

ABSTRACT OF THE DISCLOSURE

An actuator, operated by being supplied with electric power,
needs an initial setting for performing a desired operation by
5 recognizing its starting position. The initial setting is
conducted when an abnormality occurs in a signal which represents
an operation of the actuator. The initial setting is also
conducted when a system for the actuator recognizes a fact that
a battery is electrically disconnected in association with
10 information denoting a condition of the battery in a memory.
